# Leading with Water

## GF Building Flow Solutions

We make water flow in buildings, empowering customers in residential and commercial spaces to boost productivity and sustainability while enhancing comfort, health, and efficiency. Our reliable hot and cold water, waste water, and energy-efficient heating and cooling solutions are available in over 80 countries. Through GF Building Flow Solutions, we bring together two powerful global brands: GF and Uponor.

## Innovation Champion in sound-proof waste water systems

The GF waste water production sites are pioneers in manufacturing soundproofed pipes. GF Building Flow Solutions continues to be the expert for robust and reliable plastic pipes for waste water application.

**Waste water systems produced to the highest GF standards  
– for more than 50 years**

## Çerkezköy, TR

# Superior Supply Chain Processes

GF Building Flow Solutions, a division of GF, is a leading global provider of sustainable and innovative solutions, making water flow in buildings. The division, stemming from the 2023 acquisition of Uponor by GF, provides safe solutions for hot and cold water supply and control, noise-reducing waste water systems, as well as energy-efficient heating and cooling. Its focus is to enable its customers in the residential and commercial space to be more productive and sustainable, while ensuring comfort, health and efficiency. GF Building Flow Solutions has sales companies in 30 countries and production sites in 13 locations across Europe and the Americas.

## Anticipating with expertise and trust

Reliability is essential in waste water management. Our advanced solutions exceed industry expectations. With cutting-edge materials and over 100 years of expertise, we offer systems that are durable, easy to install, and require minimal maintenance. From noise-reducing technology to odor-blocking valves, every feature is designed to enhance comfort and usability.

C

Choosing GF Building Flow Solutions means embracing a future where waste water systems are not a challenge – they are a seamless part of modern, comfortable living.

The right choice for speed and excellence

# The full GF Building Flow Solutions Waste Water competence

## The right solution for every application.

### GF Building Flow Solutions Waste Water Systems

In construction, every detail counts. Installers and planners face more than just technical demands when designing drainage systems. Noise, fire safety, and long-term reliability are critical concerns. Buildings need more than efficient solutions; they require systems that guarantee comfort and safety for those who live and work in them.

#### Turning challenges into comfort

At GF Building Flow Solutions, we understand these challenges. For decades, we've developed waste water systems that go beyond basic functionality. Our solutions reduce noise, improve fire safety, and ensure long-lasting performance. Whether for single-family homes or multi-story buildings, we create systems that ensure peace, quiet, and security for occupants. Our solutions include:

- Acoustic House Drainage
- House Drainage
- Air Admittance Valves
- Drain Inlets

#### Anticipating with expertise and trust

Reliability is essential in waste water management. Our advanced solutions exceed industry expectations. With cutting-edge materials and over 100 years of expertise, we offer

systems that are durable, easy to install, and require minimal maintenance. From noise-reducing technology to odor-blocking valves, every feature is designed to enhance comfort and usability.

Choosing GF Building Flow Solutions means embracing a future where waste water systems are not a challenge – they are a seamless part of modern, comfortable living.

GF Building Flow Solutions, a division of GF, is a leading global provider of sustainable and innovative solutions, making water flow in buildings. The division, stemming from the 2023 acquisition of Uponor by GF, provides safe solutions for hot and cold water supply and control, noise-reducing waste water systems, as well as energy-efficient heating and cooling. Its focus is to enable its customers in the residential and commercial space to be more productive and sustainable, while ensuring comfort, health and efficiency. GF Building Flow Solutions has sales companies in 30 countries and production sites in 13 locations across Europe and the Americas.

## Benefits of Plastics

Plastics are polymers created by the chemical conversion of natural products or synthesized from organic materials. The primary components that make up the building blocks of plastics are long chains of carbon (C) and hydrogen (H) known as monomers.

The raw materials used for the production of plastics are natural compounds such as cellulose, coal, oil and natural gas. In the plastics industry, around 6 % of the petroleum products that come out from refineries is used.

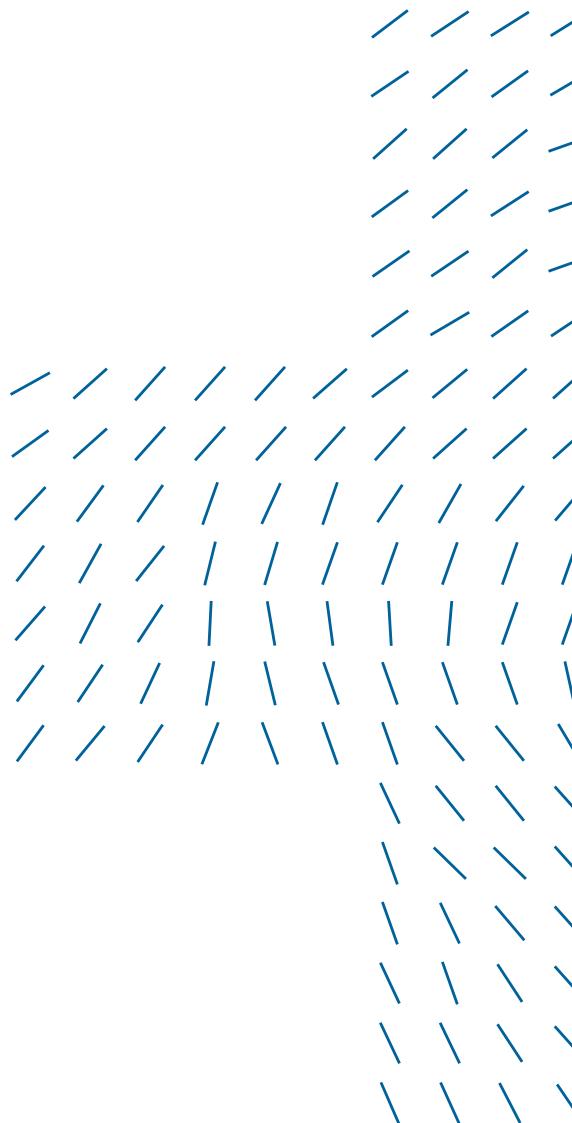

Plastics fall into three main categories on the basis of their internal structure and the resulting mechanical characteristics: thermoplastics, thermosetting plastics and elastomers.

Thermoplastics in turn can be split into two main categories as partially-regulated (semi-crystalline) and irregular (amorphous) molecular structures.

Semicrystalline thermoplastics, which have a partially ordered molecular structure: this category includes the polyolefins (polypropylene, polyethylene, polybutylene) and fluoropolymers (PVDF, PTFE, etc.)

Amorphous thermoplastics, which have no crystalline regions and no packed molecular structure: this category includes the vinyl chlorides (PVC-U, PVCC, etc.) and styrenes (ABS, polystyrene, etc.)

Semi crystalline materials are more suitable for hot welding, while amorphous thermoplastics are ideal for cementing or cold welding (solvent cementing).

## Advantages of Plastic Systems

Thermoplastics obviously demonstrate different characteristics than those of the metals traditionally used for piping.

### Metal Systems

#### High density

- Crane needed for transport
- Widely spaced fixings
- High anchoring forces, fixing required

#### Thermal conductivity

- Insulation is always needed to limit heat loss
- Formation of condensation and resulting corrosion

#### Corrosion Behaviors

- Galvanic corrosion may occur
- Internal diameter is reduced due to corrosion  
Reduction in internal diameter leads to pressure losses

#### Chemical resistance

- Low resistance to acids, requiring use of costly alloys
- Damage from incrustation

### Plastic Systems

#### Low density

- Can be carried by hand up to d110
- Closely spaced fixings
- Limited anchoring forces, simple and economic

#### Low thermal conductivity

- Limited heat loss
- Low levels of condensation and resistance to corrosion

#### High Corrosion Resistance

- No risk of galvanic corrosion risk
- No corrosion and reduction of internal diameter  
No pressure losses due to lack of reduction of internal diameter

#### High chemical resistance

- \* In combination with correct jointing methods, at least 25 years of useful life can be warranted
- No incrustation

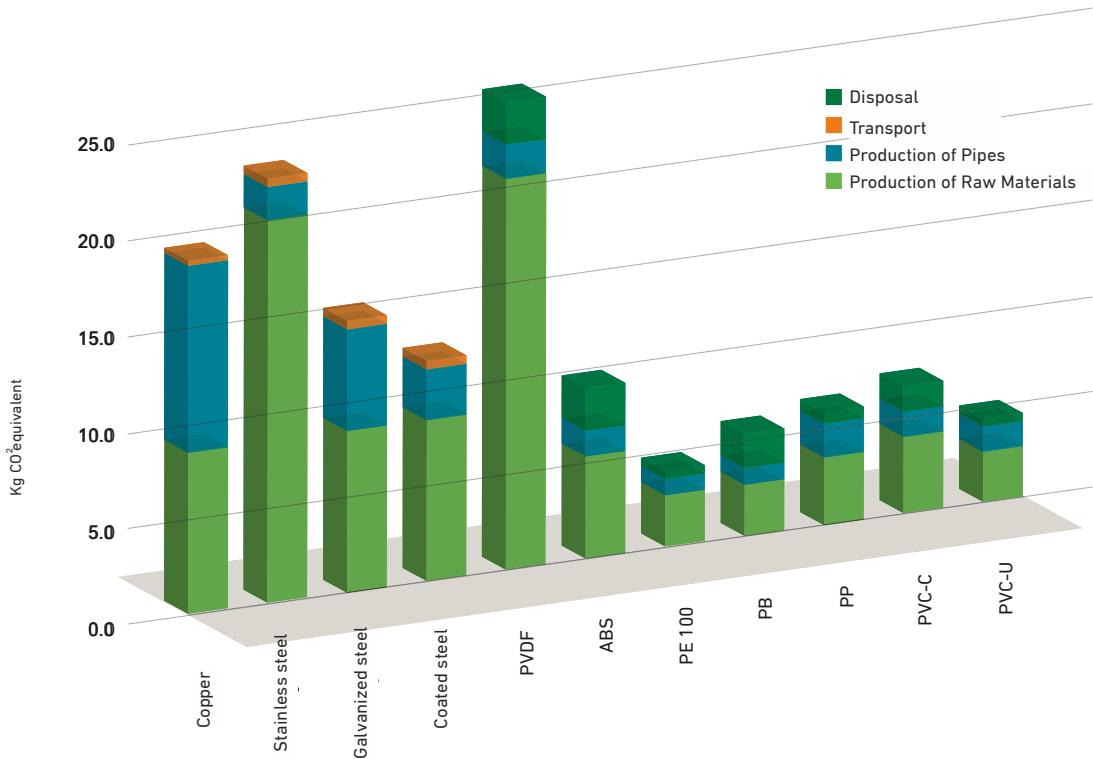

## Service Life Analysis of Plastics

It is the total of all greenhouse gases emitted to the atmosphere during the entire lifetime including the processes for extracting a product having carbon footprint from under the ground, refining, producing, using and disposing of that product.

The following graphics indicate the assessment of the lifetime of thermoplastic piping systems in terms of the quality of their environmental performance and application of them in building technology, industry and water and gas distribution. In the analysis, the impacts of one meter long pipe was compared with the main competitor materials (DN25, DN80, DN150 and DN400) for each of the commonly used plastics. GF supplied this analysis from an independent, Swiss-based organization specialized in environmental performance analyzes, and is based on Ecoinvent, leading lifecycle inventory database in the world.

According to the main results of the study, plastic piping systems demonstrate better performance than metal systems. This finding has been confirmed by other studies conducted in this field.

The main reason for high performance of thermoplastics is that they are lightweight. This ensures key benefits during transport and installation. Fully-plastic solutions are lighter than other piping systems of conventional materials, and this creates significant impacts on carbon footprint.

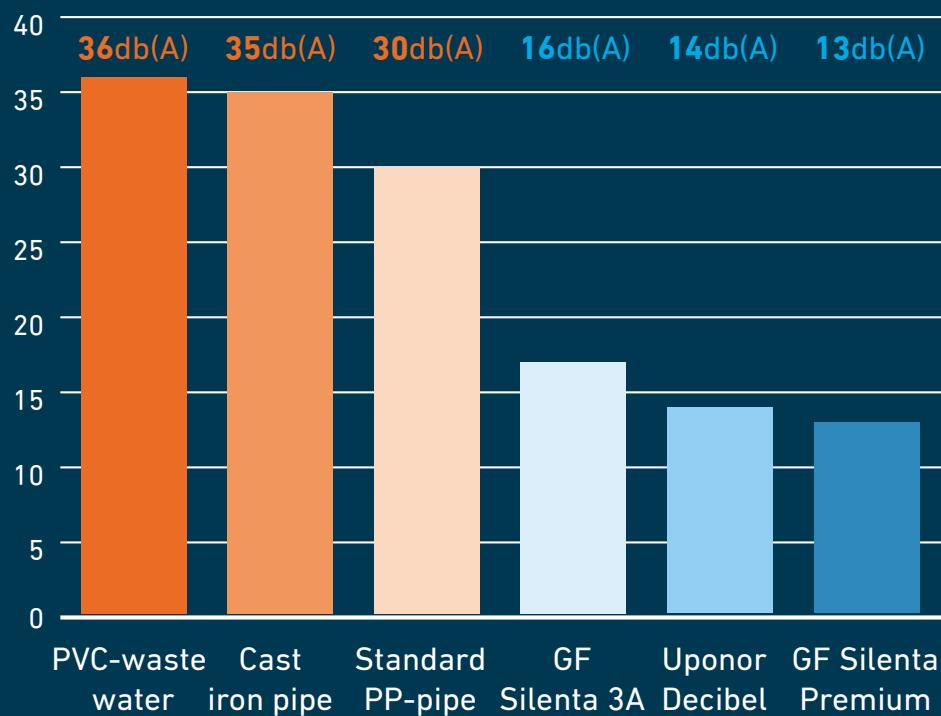

# Quiet comfort, proven performance

Waste water disposal can often result in unwanted noise, both structure-borne and air-borne. At GF Building Flow Solutions, we tackle this challenge head-on with our Acoustic In-House Drainage Pipes. Designed to reduce noise at the source, our pipes ensure a quieter, more comfortable living environment. Certified by the Fraunhofer Institute for Building Physics in Stuttgart, our systems deliver top-tier acoustic performance. The graph on this page illustrates the significant reduction in noise levels, highlighting the superior soundproofing of our solutions.

**With GF Building Flow Solutions, you choose silence, comfort, and proven quality.**

## Leader in low noise waste water systems

# Quality Certificates

Manufacturing its products in accordance with the European standards and Turkish standards equivalent to the European standards, our Company is a leading and dynamic organization in terms of continuous improvement and customer satisfaction.

In addition to product quality, the process and system quality of GF Hakan Plastik is certified by BVQI through TS EN ISO 9001:2015 certificate.

Our Company that places top priority on process and system quality also has TS EN ISO 14001:2015 and TS EN ISO 45001:2018 certificates. Our production plant in Çerkezköy have TS EN ISO/IEC 17024:2012 laboratory.

# GF Silentia Premium

Silenta Premium is a sound-insulated, three-layer sewage pipe system made from high-quality PP-material, specifically designed and reinforced for non-pressurized domestic drainage in accordance with the system standards DIN 4109 and DIN 4102. The acoustic performance of Silenta Premium has been accredited by the Fraunhofer Institute in Germany, ensuring exceptional noise reduction. It is ideally suited for hot, cold, and acidic waste water, offering outstanding durability and performance. The system's sturdiness is further enhanced by its impact-resistant design. Available in pipe diameters ranging from 58 mm to 200 mm, Silenta Premium also includes a variety of fittings and accessories, making it a reliable and versatile solution for modern drainage systems.

### Features

- Excellent sound insulation
- Flame-retardant
- Halogen-free and no release of toxic gases in event of fire
- Acid-resistant
- Temperature-resistant

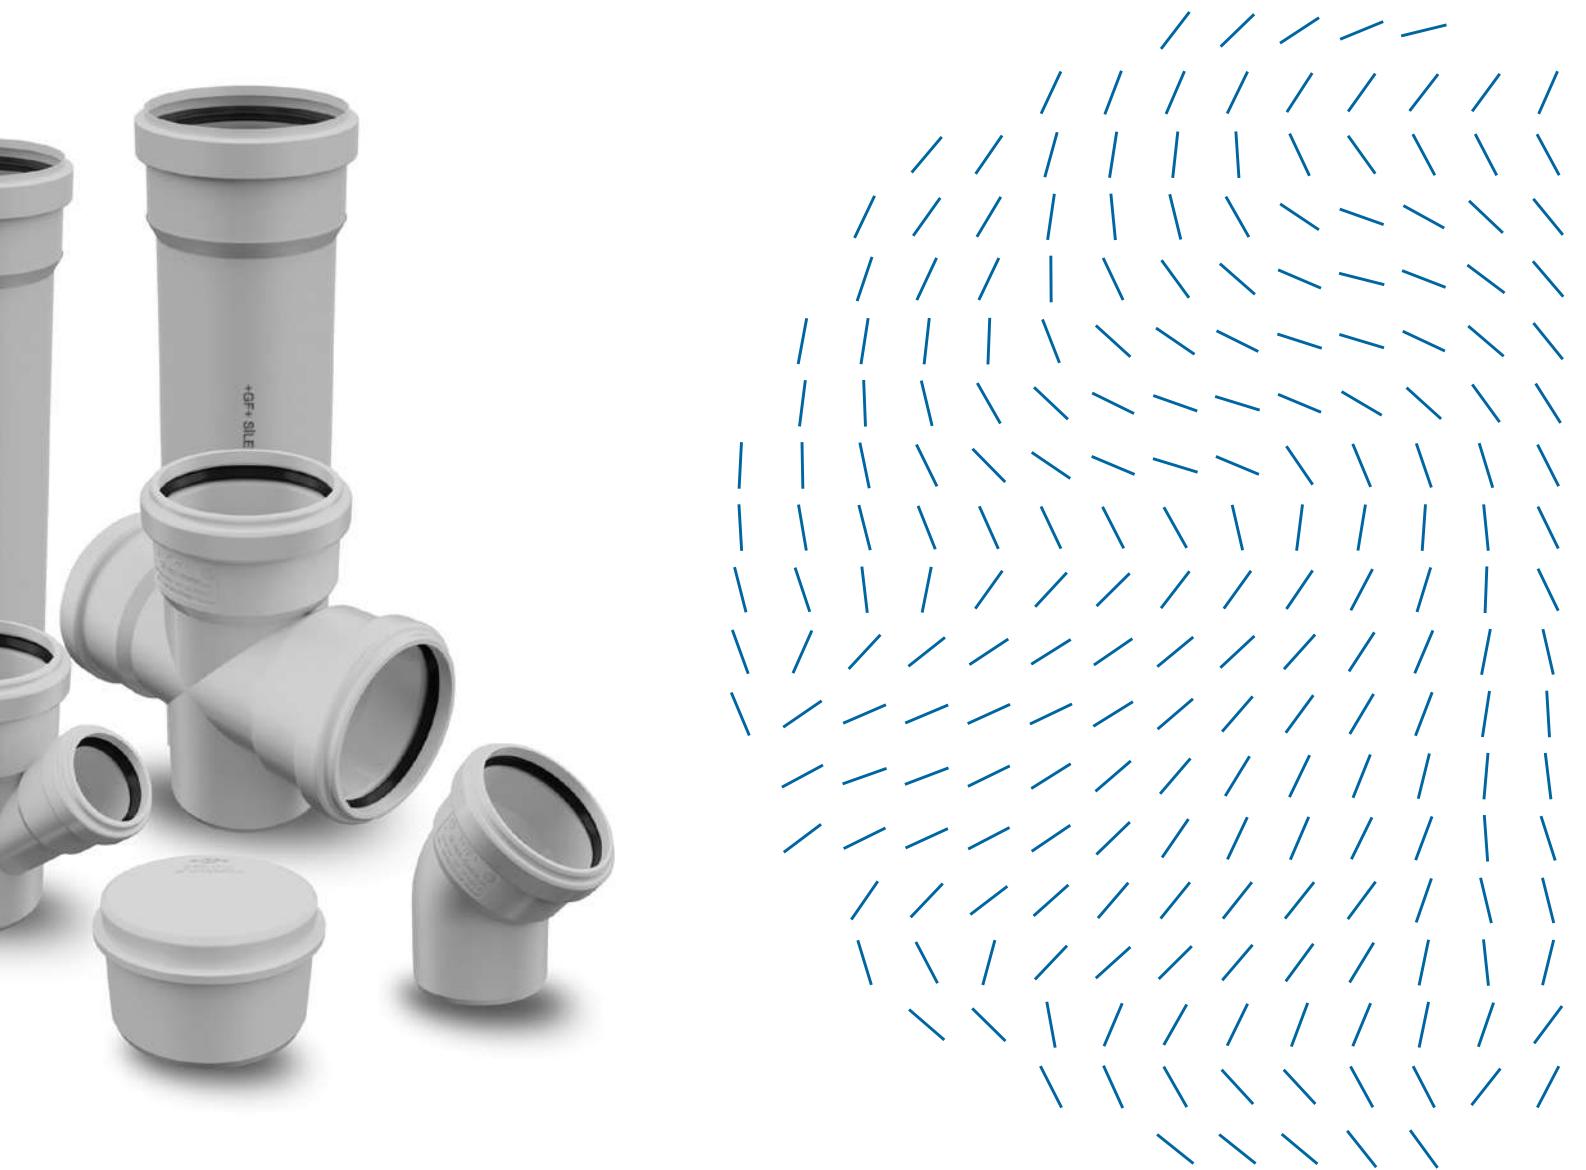

### Benefits

- High level of comfort
- Extending life cycle of entire system
- Securing safety and health during event of fire

### Field of application

Type	Details
Work areas	Office buildings, hospitals, conference halls, etc.
Public domains	Schools, colleges libraries, community centers, tutoring centers, etc.
Residential buildings	Houses, residences, apartments, hotels, etc.

## Technical facts

Type	Details
Diameter	Ø 58 mm - Ø 200 mm
Length	0.15mt - 3mt
Color	Light grey
Acoustic performance	13 dB(A) / 4lt/s acc. EN14366
Flammability class	B2 acc. to DIN 4102
Pipes	With and without socket
Standards	DIN 4109, DIN 4102-B2

# Superior Sound-Proof Performance

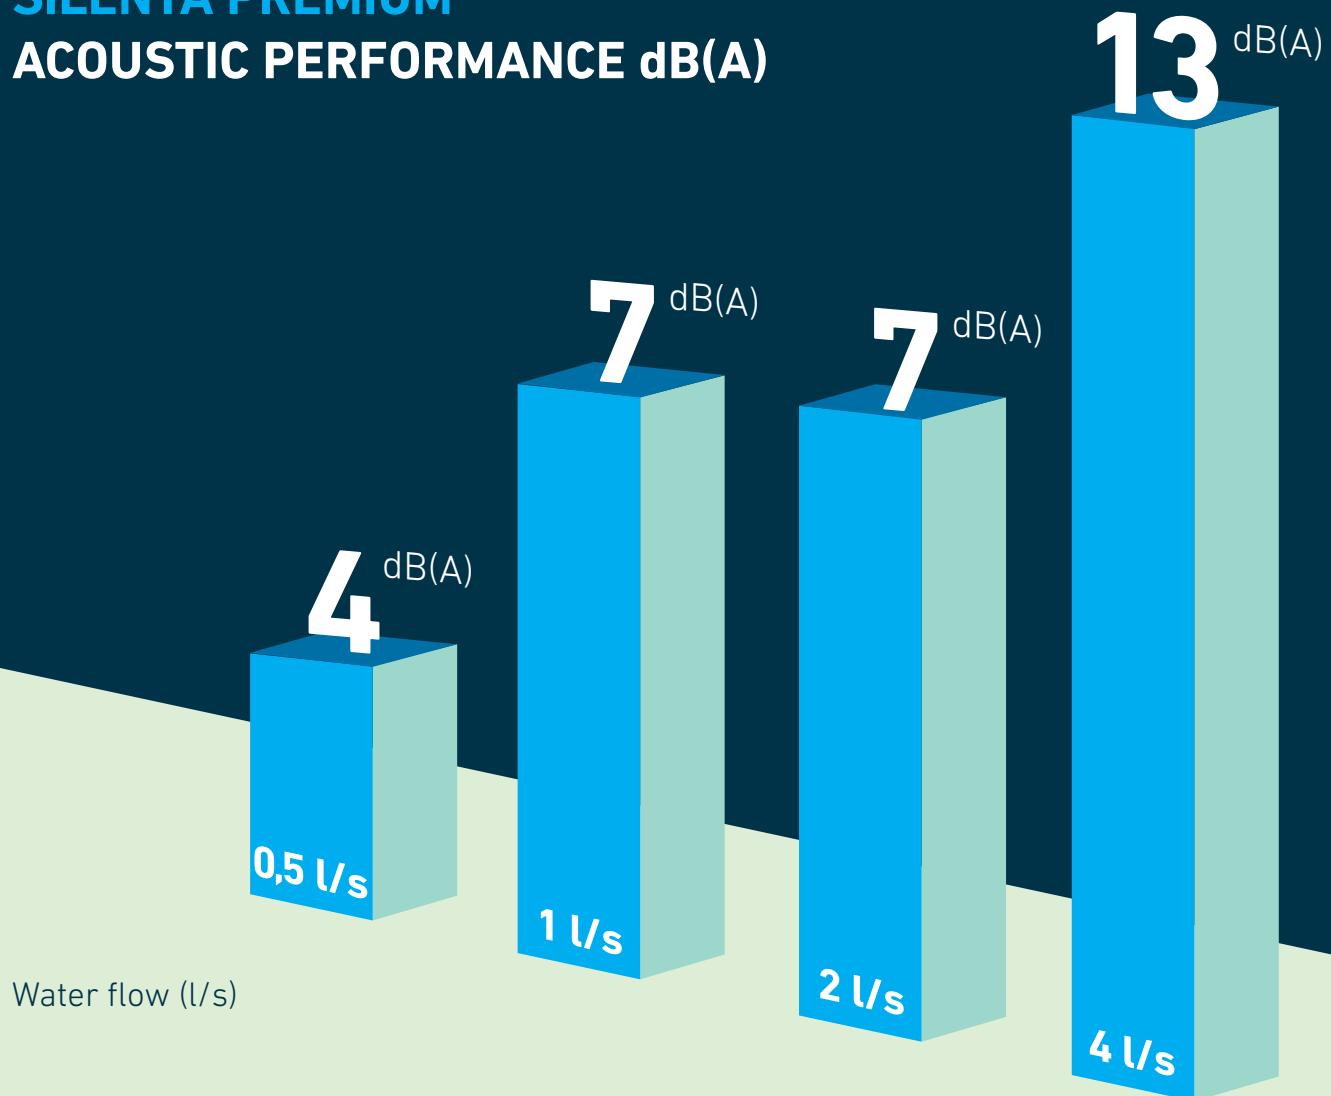

Sound-insulated soil and waste water pipe system **Silenta Premium** guarantees quality, peace of mind and living comfort.

Acoustic performance of Silenta Premium was accredited by the famous German Fraunhofer Institute, in compliance with DIN 4109 and EN 14366.

Noise measurement tests were carried out at Fraunhofer Physical Constructions Institute in Stuttgart, the most accredited European laboratory on noise studies on buildings. The acoustic performance tests were conducted in compliance with the standard DIN EN 14366.

The emitted noise level at **4 l/s** flow rate, with special GF Hakan Silent clamps, is only **13 dB(A)** according to **DIN EN 14366**.

# What is Sound Insulation Performance?

Sound insulation performance is the sound insulation capability of the system against the vibrations that occur between the pipes used in the waste water installation and the fluids transmitted through these pipes. With Silenta Premium, Silenta 3A and Silenta FR Piping Systems, GF Hakan Plastik offers ultimate solutions against the sounds created in the installations.

## Sources of sounds in the buildings can be listed as follows:

- Flushing
- Clogging of the flowing direction
- High water speeds
- Joints
- Discharge
- Wrong planning
- Faulty design

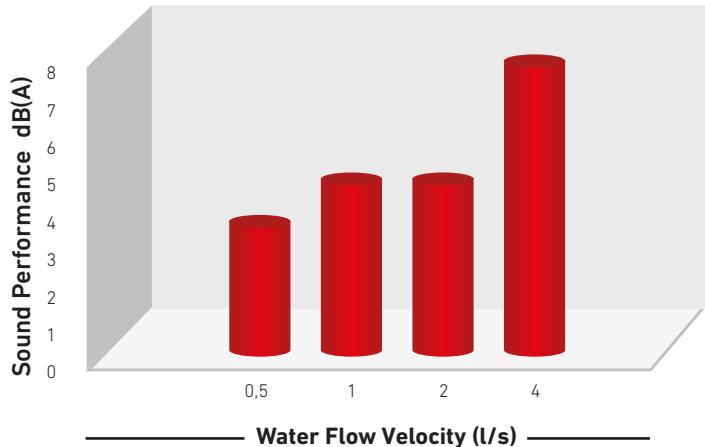

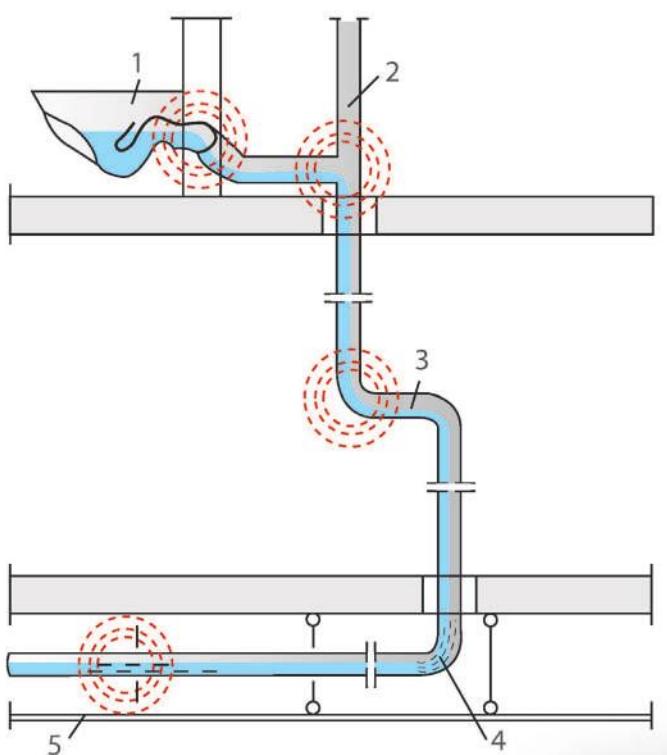

Due to critical drainage conditions, local vibrations occur in the piping system passages. They could have adverse impacts on sound characteristics.

To minimize and eliminate these impacts, Silenta Product Ranges reduce noise in the sound-critical areas with elbows having nominal widths of DN 58-DN 200, and ensures better noise reduction in the affected areas.

## Why is Sound Protection Necessary?

Sound protection measures in a building aims to minimize the noise pollution in the rooms. Residents need to be protected against the noises emitted through air or caused by the building.

Unpleasant noises within the building as caused directly (created by the building) or indirectly (for example due to the construction engineering systems) can be easily resolved with the use of Silenta Product Range.

The above graphics indicate the results of the acoustic tests conducted by Fraunhofer Building Physics Institute.

*Silenta Premium 13 dB(A) at 4 l/s flow  
Silenta 3A 16 dB(A) at 4 l/s flow  
Silenta FR 12 dB(A) at 4 l/s flow*

# GF Silenta 3A

Silenta 3A is a sound-insulated, three-layer drainage pipe system made from high-quality PP-material, specifically designed and reinforced for non-pressurized domestic drainage in compliance with the system standards of DIN EN 1451, DIN 4109, and DIN 4102. The acoustic performance of Silenta 3A has been certified by the Fraunhofer Institute in Germany, ensuring superior noise reduction. This system excels in environments where impact resistance, durability, and sound insulation are crucial. Available in pipe diameters ranging from 40 mm to 200 mm, the range also includes a variety of fittings and accessories, making it a versatile and reliable choice for modern drainage solutions.

### Features

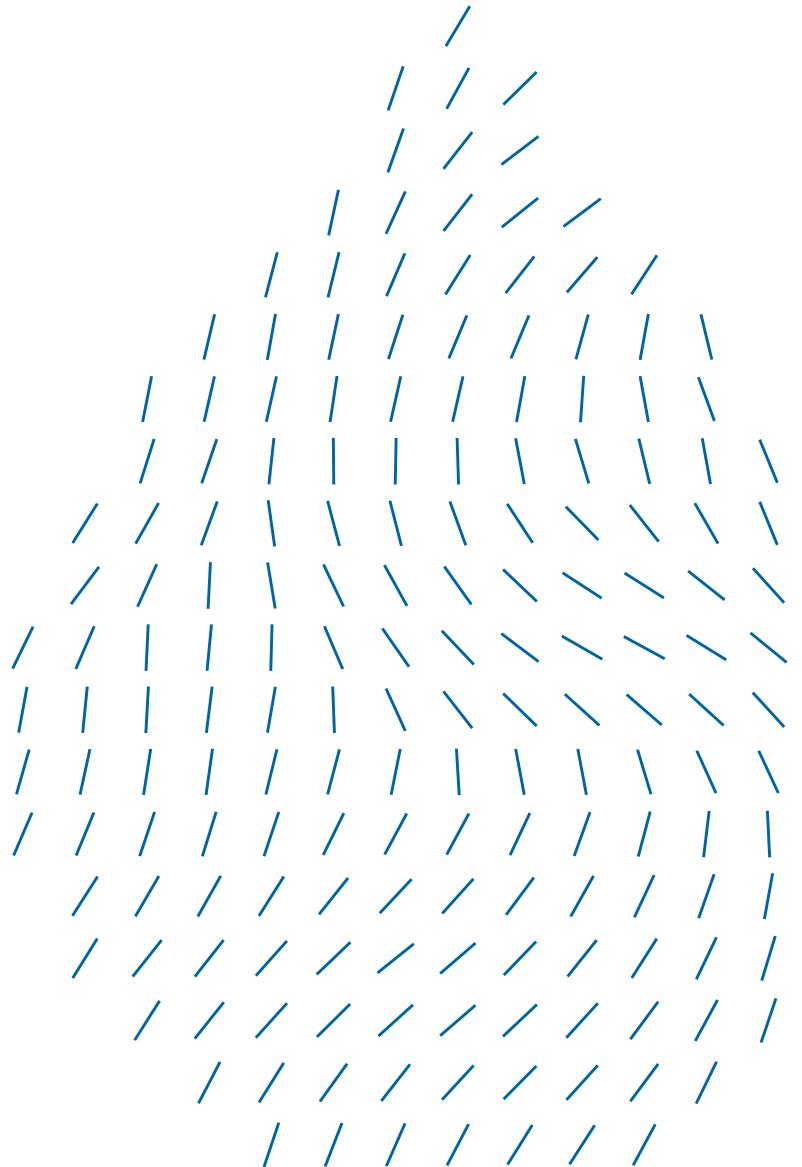

- Excellent sound insulation
- Flame-retardant
- Halogen-free and no release of toxic gases in event of fire
- Acid-resistant
- Temperature-resistant

### Benefits

- High level of comfort
- Extending life cycle of entire system
- Securing safety and health during event of fire

### Field of application

Type	Details
Work areas	Office buildings, hospitals, conference halls, etc.
Public domains	Schools, colleges libraries, community centers, tutoring centers, etc.
Residential buildings	Houses, residences, apartments, hotels, etc.

## Technical facts

Type	Details
Diameter	Ø 40 mm - Ø 200 mm
Length	0.15mt - 3mt
Color	Light blue
Acoustic performance	17 dB(A) / 4lt acc. EN14366
Flammability class	B2 acc. to DIN 4102
Pipes	With socket
Standards	DIN EN 1451-1, DIN 4109, DIN 4102-B2

# Superior Sound Proof Performance

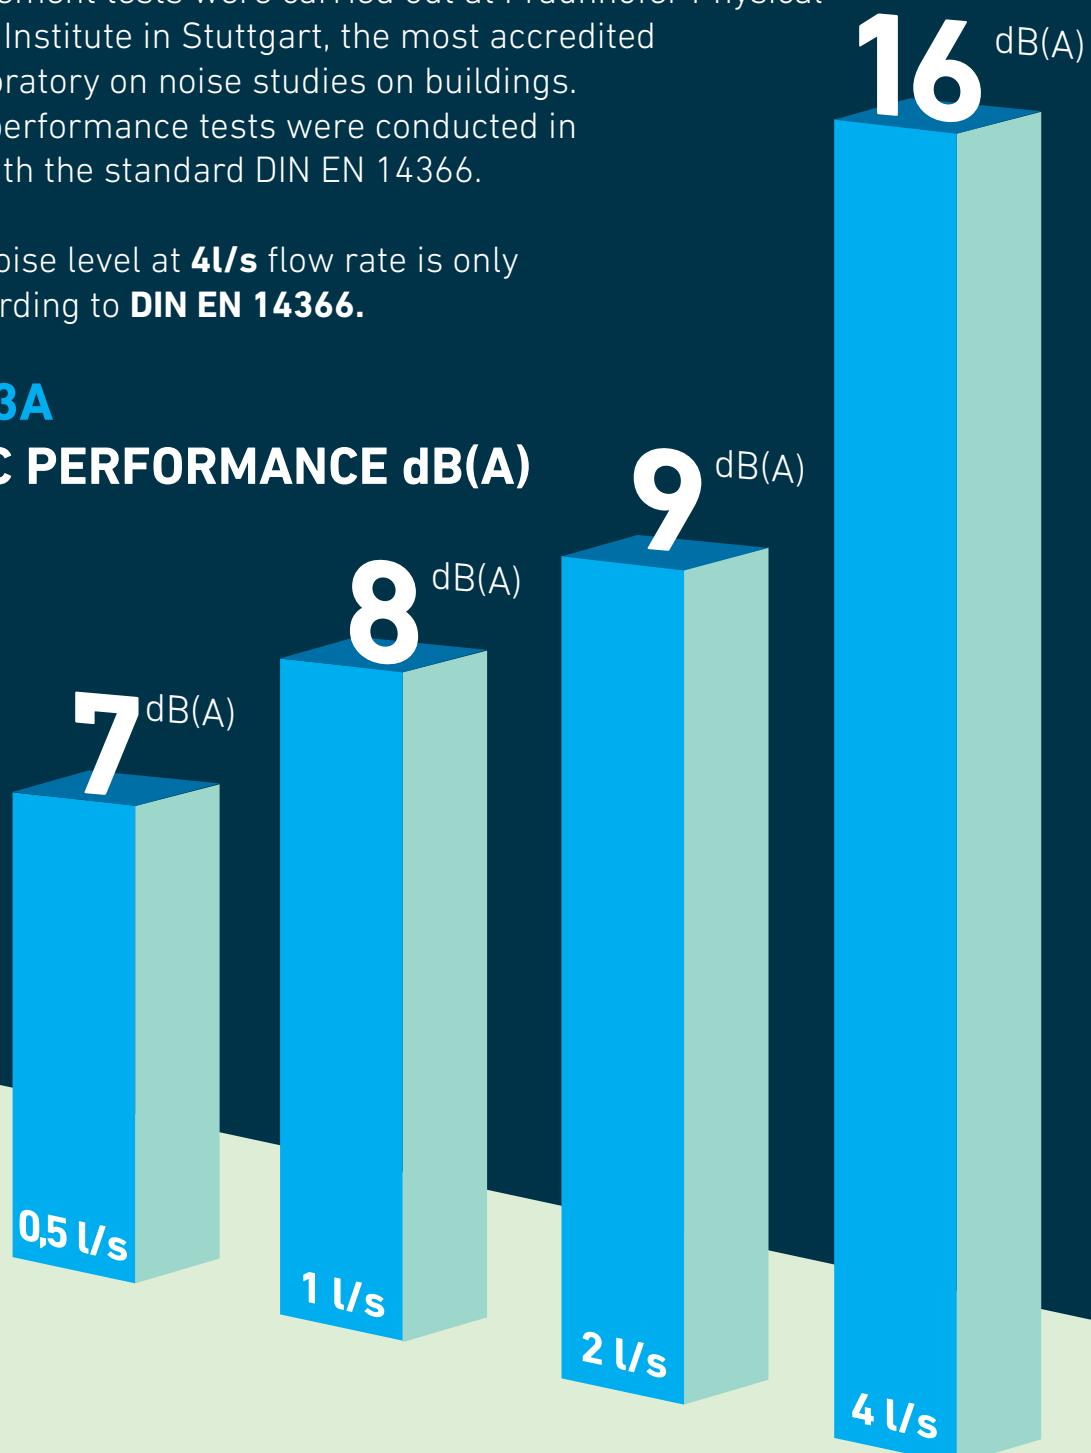

**Sound-insulated soil and waste piping system Silenta 3A** guarantees quality, peace of mind and living comfort.

Acoustic performance of Silenta 3A was accredited by the famous German Fraunhofer Institute, in compliance with DIN 4109 and EN 14366.

Noise measurement tests were carried out at Fraunhofer Physical Constructions Institute in Stuttgart, the most accredited European laboratory on noise studies on buildings. The acoustic performance tests were conducted in compliance with the standard DIN EN 14366.

The emitted noise level at **4 l/s** flow rate is only **17 dB(A)** according to **DIN EN 14366**.

# GF HT-PP

HT-PP pipes and fittings are made from high-quality polypropylene, ensuring lightweight construction and exceptional resistance to chemical agents and abrasion. These properties make them ideal for building waste and drainage systems, as well as other underground applications, in compliance with EN1451-1. Additionally, they feature a B2 flammability class for fire resistance, as per DIN 4102, providing enhanced safety and reliability in a variety of installations.

### Features

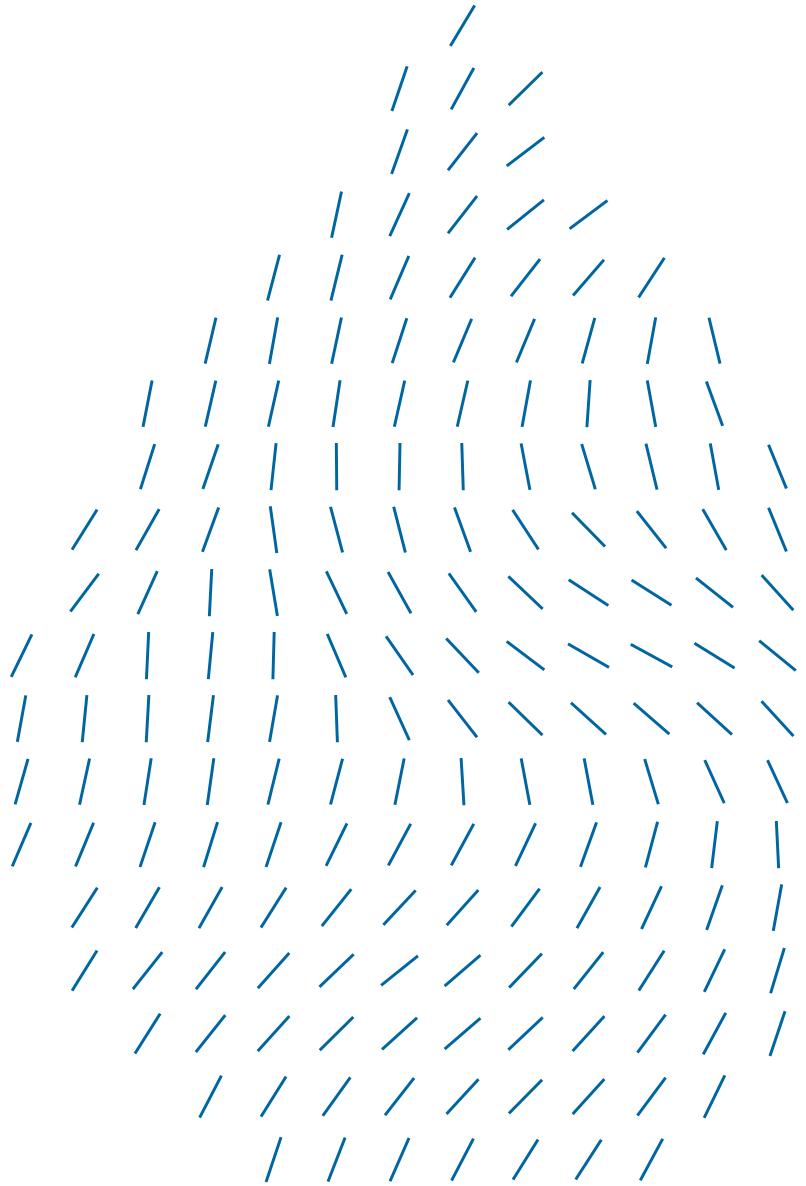

- High impact resistance
- Low weight
- Easy and cost-efficient jointing technology

### Benefits

- No product loss during logistics and assembly
- Simplifies logistics and installation process
- High time- and effort-efficiency

### Field of application

# **Building Technology (BT) Solid and Waste Water Pipe Range Installation Instructions**

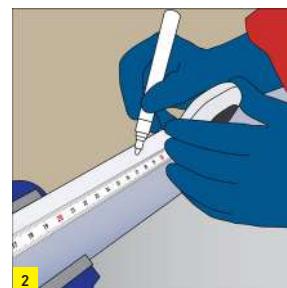

- Silenta Premium Sound-Insulated Pipe Systems
- Silenta 3A Sound-Insulated Pipe Systems
- HT-PP Waste Water Pipe Systems

## Installation

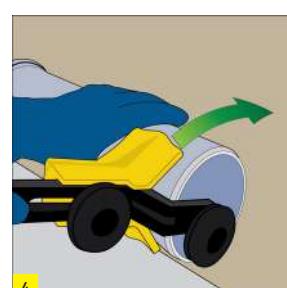

Make sure that your products are clean. If necessary, wipe the jointing points with a dry cloth.

When interval measurements are required, mark the pipe with the desired measurements.

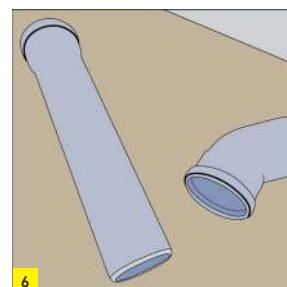

Cut in 90° angle by using a coping saw or a proper cutter.

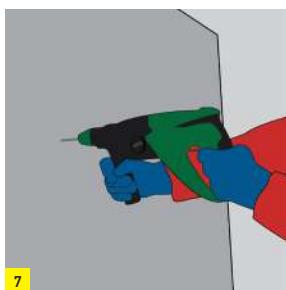

Chamfer the spigot of pipe by using a chamfering device or thick riffler.

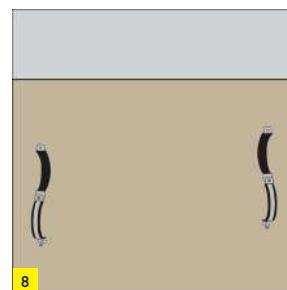

Remove the burrs on the external edges with a knife or scraper.

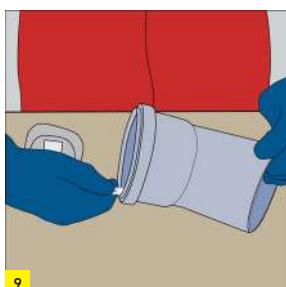

Now, your pipe is ready for installation.

Drill the marked points with a driller and place dowels into the holes.

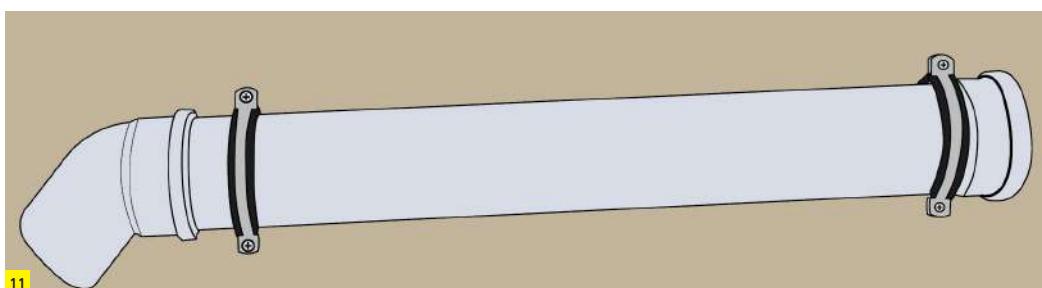

Mark the pipe clamp distances properly with 1% inclination on the wall or ceiling where they will be installed. (as flat wall)

Mark the part of the pipe that will be attached to the fitting as much as the jointing distance.

Apply a lubricating liquid (silicone etc.) to the socket part of the pipe.

After the pipe and fittings are jointed, place them and tighten the clamps.

## Installation

### Rubber Ring (Push Fit) Jointing

- 1- Mouth of the pipe should be absolutely chamfered. If the mouth of the pipe was cut, it should be chamfered.
- 2- Check if the sealing gasket is accurately placed on the pipe or fitting socket groove.
- 3- All installation parts should be dry and clean. There should be no deformation, notches or similar scratches on the pipes or fittings.
- 4- Apply a proper silicone-based lubricating liquid on the spigot end of the pipe or fitting. Do not use liquid soap, grease or similar petroleum derivatives.

- 5- Parts to be jointed should be levelled.
- 6- Push the spigot end of the pipe or fitting into the socket completely. If the application is longer than 2 m, pull the spigot end 10 mm back after placing it into the socket completely, to prevent the effects of thermal expansion.
- 7- Finally, check again if the gap left for thermal expansion still exists or not.

### Pipe Hanging and Clamping

Always use GF Hakan silent pipe clamp to minimize the sound caused by vibration. Maximum clamping distances of the pipes should always comply with the values provided in the following table.

- 1- While fixing the pipe with clamps, pay special attention to not cause any tension and stress on pipes.
- 2- Pipe cannot move after tightening the screws of the fixed clamps. For sliding clamps, pipe will continue to move inside the clamp even after tightening the screws.
- 3- For each line longer than 2 m, use 1 fixed clamp immediately after the muff part.
- 4- In vertical lines, always place the fixed clamp on the top point of the pipe and below the socket part.

- 5- While fitting the fixed clamp, pay attention to keep 10 mm distance left on the flat end for expansion.
- 6- Use a fixed clamp after each fitting or fitting group.
- 7- All clamps to be added to the system apart from the fixed clamps in the horizontal or vertical line should be sliding clamp that allows for thermal expansion caused by temperature changes.
- 8- Pipes and fittings should be fixed in short distances so that they do not slide and release.

### Maximum distances between the clamps

Nominal External Diameter DN [mm]	Clamp Distance	
	For Horizontal Pipe Directions* Dmax m (max. 15 x da)	For Vertical Pipe Directions* Dmax. m
50	0,75	1,50
75	1,10	2,00
90	1,35	2,00
110	1,65	2,00
125	1,85	2,00
160	2,40	2,00
200	3,00	2,00
250	3,00	2,00

# Installation

## Silent Pipe Clamp

Silent waste water piping systems are tested by the German Fraunhofer Building Physics Institute in accordance with EN 14366 standard, and the reports about sound level are issued by this institute.

In the test equipment used in this institute, sound levels are measured at different flows and different parts of the building.

In the vertical lines, one group double and one single clamp should be used on each floor. In the horizontal lines, it is more suitable to use single clamp.

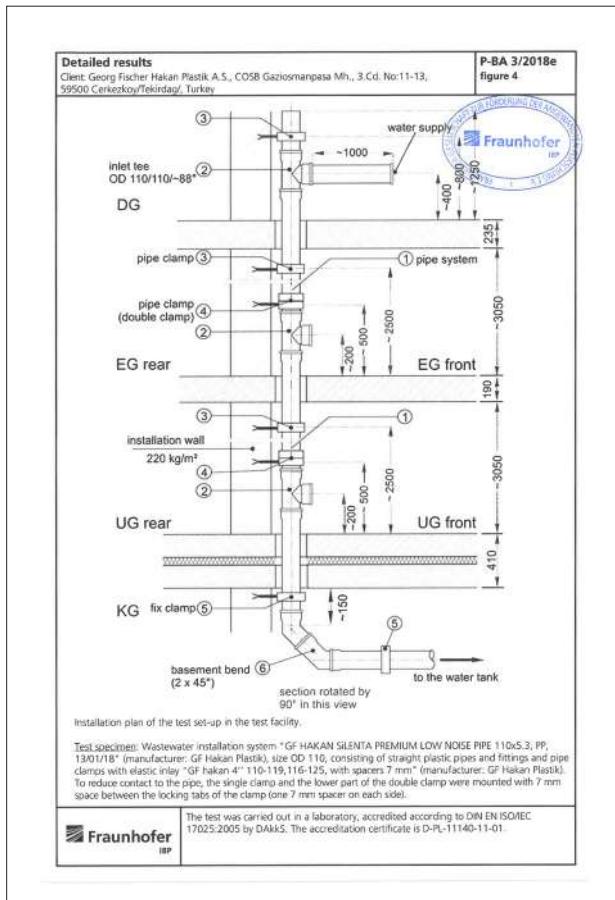

The test equipment in the institute laboratory is standard and the tests related to all waste water systems are conducted here. As seen in the test equipment below, pipe, fittings, installation wall thickness, water discharge amount as well as silent pipe clamp systems are also significant factors in the test report.

### Clamp Details

The clamp on top, which is one of the double clamps used in the vertical lines, is fully tightened and grasps the pipe. The lower clamp is tightened up to the plastic wedges on the clamp. It is ensured that the rubber surfaces of the clamp are not jointed. In this system, the purpose is to absorb the vibration transmitted from waste water to pipe inside the first clamp and to minimize the vibration on the wall through the second clamp.

The single clamp in the vertical lines is tightened up to the plastic wedges on the clamp and it is ensured that the pipe is fixed to the wall. The single clamp in the horizontal lines is tightened up to the plastic wedges on the clamp and it is ensured that the pipe is fixed to the ceiling or wall.

To achieve maximum acoustic performance, the silent pipe clamps used in the test should be used in the installations as well.

Although there are different types of silent pipe clamps, they are available in two kinds as fixed and movable.

The noise created in the waste water systems is transmitted by two methods as air born and structure born.

1- Sound waves transmitted through air cause pressure in the ambient and result in vibration on the objects and surfaces that they hit. Thanks to the special formulas used in GF Hakan Plastik Silenta products, these vibrations are absorbed and prevented from being transferred out of pipe.

2- Sound waves transmitted through contact occur as a result of the waste water and waste hitting the pipe wall. These vibrations are transferred on the wall of the installation through contact. The sound created by contact is significantly absorbed by the special molecular structure of Silenta and specially-designed GF Hakan silent clamps.

## Installation

GF Hakan silent waste water pipe clamps ensure EN 14366 silence norms. In the waste water systems within buildings, cased clamps, their positions and distances are as important as silent pipes and fittings.

The clamp on top, which is one of the double clamps used in the vertical lines, is fully tightened and grasps the pipe. The lower clamp is tightened up to the plastic wedges on the clamp. It is ensured that the rubber surfaces of the clamp are not jointed. In this system, the purpose is to absorb the vibration transmitted from waste water to pipe inside the first clamp and to minimize the vibration on the wall through the second clamp.

The single clamp in the horizontal lines is tightened up to the plastic wedges on the clamp and it is ensured that the pipe is fixed to the ceiling or wall.

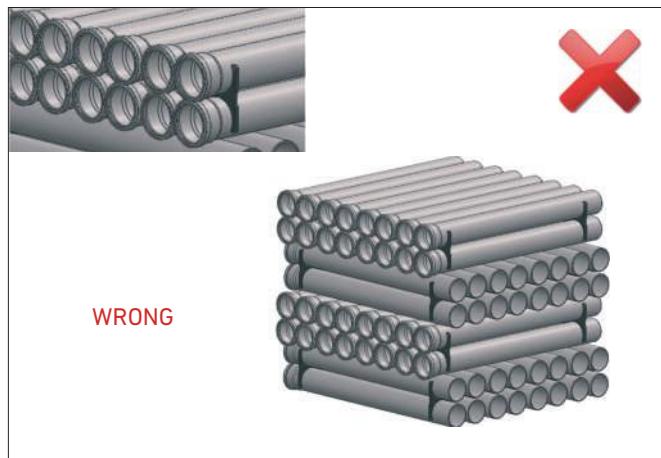

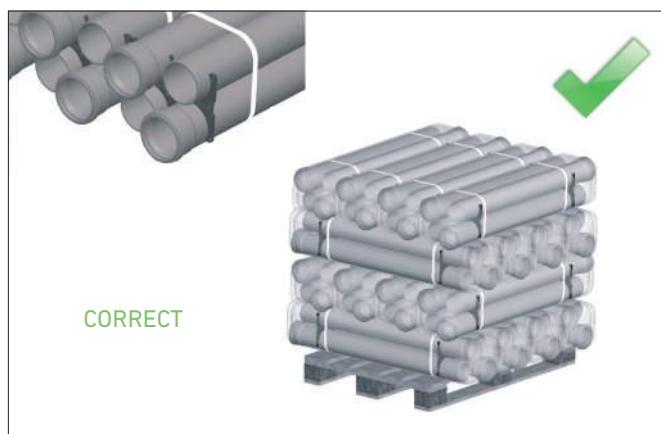

# Packaging, Storage and Transportation

## Packaging

GF Hakan Plastik pipes and fittings are packed as ready for transport in a customer-friendly way. Packing ensures safety, efficient storage and easy transport.

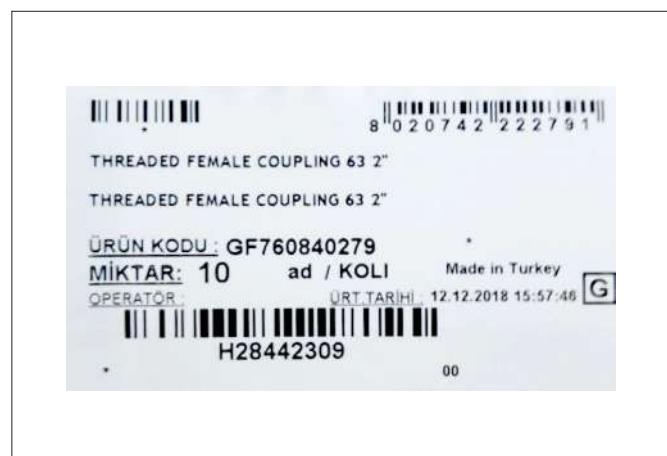

Pipes and fittings with socket are placed in a way that they will not stay on top of each other.

Pipes are packed by plastic clamps to hold them together. Stretch film is applied to protect pipes from pipes dust and stains.

Short parts with the length of 150, 250 and 500 mm are packed in carton boxes like connection parts.

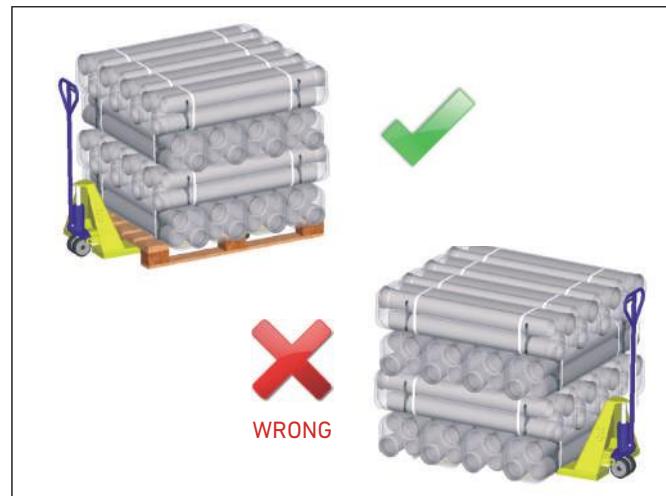

All product ranges are identified in the Warehouse Management System (WMS) by barcode label. Barcode system ensures management of products and prevents complexity and errors during storage and loading.

## Storage

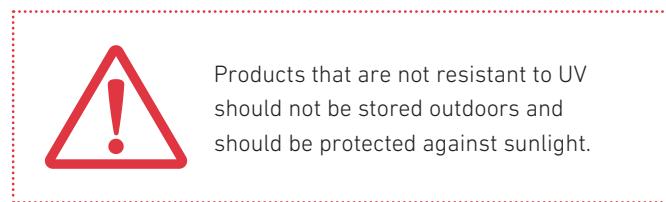

Method of storage should not cause any outflow and should not damage the pipes. As long as they are stored properly, no permanent deformations or damages will occur on the pipes and fittings. Pipes should not be stacked above 1,5 m. Pipes should be safe against sliding.

Pipes packed in the factory might be stacked on wooden frames. Appropriate materials such as pallet etc. should be used to prevent any damage on the socket parts of the pipes stored for a long time. This also makes it easier to lift the pipes by from the flor.

Pipes and fittings packed in carton boxes should be protected against moisture.

Carton boxes should be sealed and stored in a dry area.

## Transportation

Pipes should be carefully transported to prevent any damages. Avoid sudden and hard pressures on pipes and fittings that might cause freezing in cold weather conditions. Ensure that pipes are not滑动和dropped on the floor. Loading and unloading and packing of pipes in a block should be carried out by means of forklifts having flat threads and extensions.
